

Project 1: Financial Analytics  
Work Flow 1: Data Cleaning  
Date: 13-06-2024  
Created by: Arpita Deb  
Methodologies used: Data Cleansing, Sorting, Joining, Filtering for duplicates, Union  
Result: A cleaned data set with 8 columns - CompanyID, Company Name, Market Capitalization (in Crore), Quarterly Sales (in Crore) and Industry

This output data set contains no industry data either because the company names were written differently than the NIFTY data set or there are no records in NIFTY data set. So I need to manually enter the industries and then join this data with the original data.
